

## Lab11

1- use rest countries API to get any country's data by country name

<https://restcountries.com/v2/name/{countryname}>

and display the result as follow

for example: <https://restcountries.com/v2/name/Egypt>

2- from assignment 1 now using chaining promises (a promise that depends on another promise) to display one neighbor country

<https://restcountries.com/v2/alpha/{neighbour}>

*as shown but make it dynamically called from the value that was returned from the Country promise (don't type the name of the neighbor manually).*
